abstract we tackle two problems of interest to the software assurance community firstly existing models of software development such as the waterfall and spiral models are oriented towards one off software development projects while the growth of mass market computing has led to a world in which most software consists of packages which follow an evolutionary development model this leads us to ask whether anything interesting and useful may be said about evolutionary development we answer in the affirmative secondly existing reliability growth models emphasise the poisson distribution of individual software bugs while the empirically observed reliability growth for large systems is asymptotically slower than this we provide a rigorous explanation of this phenomenon our reliability growth model is inspired by statistical thermodynamics but also applies to biological evolution it is in close agreement with experimental measurements of the fitness of an evolving species and the reliability of commercial software products however it shows that there are significant differences between the evolution of software and the evolution of species in particular we establish maximisation properties corresponding to murphy s law which work to the advantage of a biological species but to the detriment of software reliability

connectionist robot motion planning a neurally inspired approach to visually guided reaching is the third series in a cluster of books on robotics and related areas as part of the perspectives in artificial intelligence series this series focuses on an experimental paradigm using the murphy system to tackle critical issues surrounding robot motion planning murphy is a robot camera system developed to explore an approach to the kinematics of sensory motor learning and control for a multi link arm organized into eight chapters this book describes the guiding of a multi link arm to visual targets in a cluttered workspace it primarily focuses on ecological solutions that are relevant to the typical visually guided reaching behaviors of humans and animals in natural environments algorithms that work well in unmodeled workspaces whose effective layouts can change from moment to moment with movements of the eyes head limbs and body are also presented this book also examines the strengths of neurally inspired connectionist representations and the utility of heuristic search when good performance even if suboptimal is adequate for the task the co evolution of murphy s design with the brain presumably in response to similar computational pressures is described in the concluding chapters specifically presenting the division of labor between programmed feedforward and visual feedback modes of limb control design engineers in the fields of biology neurophysiology and cognitive psychology will find this book of great value
